

# Craft AI Reports for Government

One-click, evidence-first syntheses that make supplier intelligence briefing-ready

## Buyer outcomes

- ✓ **Minutes → briefing-ready reports:** compress manual research from weeks to minutes/hours.
- ✓ **Consistent inputs for adjudication:** standardized report templates reduce investigator variance.
- ✓ **Audit readiness:** full provenance for oversight and reproducibility.
- ✓ **Higher throughput with same teams:** triage (risk signal thresholds) + AI reports + APIs let programs scale without proportional analyst hires.

## QUICK SUMMARY

Craft AI Reports turn the company-centric data fabric into concise, domain-organized analyses for procurement, security, and program teams. Built for briefing and audit, each report surfaces the strongest signals, links directly to source evidence, and offers analyst-oriented mitigation steps so teams act with confidence and speed. Deployed across DoW SBIR/STTR programs and used by other government innovation organizations.

## What Craft AI Reports do

- **One-click generation:** produce a structured, briefing-ready report in minutes from the Craft platform or via API.
- **Domain-organized assessments:** reports synthesize evidence into program-relevant domains (examples: FOCI; commercial viability & integrity; regulatory & compliance). For DoW customers, reports can map naturally to the DoW F1–F5 SBIR/STTR risk matrix.
- **Traceable evidence & provenance:** every claim links to underlying data objects (registries, patents/publications, funding records, people/affiliations, sanctions, cyber feeds, media). Use the link to validate findings quickly.
- **Analyst-oriented mitigation:** reports surface practical follow-ups and mitigation suggestions to guide next steps and briefing preparation.
- **Integrations & scale:** secure, identity-based API delivery (JSON + PDF), bulk or on-demand, with configurable controls for constrained federal environments. Triage tooling using risk signals helps prioritize which entities should be reported on first.

## Structure & purpose

- **Report layout:** fixed sections for each risk domain; within each, top signals, short analyst assessment, and direct citations to evidence.
- **Purpose:** make adjudication faster and more consistent by delivering repeatable, auditable inputs that analysts use to brief program leads. Reports inform adjudicators and provide mitigation guidance—final determinations remain with the human decision makers.
